TECHNICAL TIPS / PERFORMANCE CURVES

Relief Valves, Pilot Operated

Applications

These relief cartridges are normally closed, pressure control elements that are fully adjustable over a wide range of operating pressures up to 5000 psi. They are typically used when accurate pressure regulation is required and spool leakage is not critical.

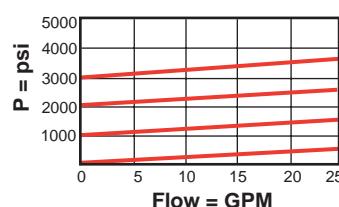

Design Concepts and Features

- Incorporates 150 micron stainless steel screen to protect the main stage control orifice.
- Low leakage, 2 to 5 in.³/min./1000 psi, dependent on frame size.
- Low hysteresis, less than $\pm 1\%$
- Selection of spring adjustment ranges with low adjustment effort.

Relief Valves, Direct Acting

Applications

This patented, direct acting, differential area valve with broad operating characteristics is adjustable to 5000 psi. Because of its exceptional performance, this relief cartridge should be considered for applications where fast response, dirt tolerance and leakage are critical. Examples of this type of application would include overshoot protection of fixed and variable volume pumps and shock protection of actuators (cylinders and motors).

Design Concepts and Features

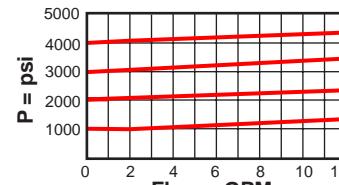

- Maximum leakage is 10 drops/min. at reseat.
- Reseat equals 90% of cracking pressure for all five frame sizes.
- Not recommended for repeated adjustment because of high adjustment effort.

Note: For both types of relief cartridge, any pressure at port 2 is directly additive to the valve settings. In situations where absolute pressure at port 1 is required; use RS*C-*** sequence cartridge or RV*D, four port relief cartridge.

General Application Requirements

- Operating Temperature Range: Buna-N seals -50° F to 200° F, Viton seals 0° F to 250° F.
- Viscosity Range: 60-3000 SUS.
- Fluid Contamination Level: ISO 4406 18/15 or better; Recommend $\beta_{10} \geq 75$ to achieve ISO 18/15 or better in most systems.
- Factory Pressure Setting for cartridge is established at a 4 GPM flow rate.
